

_____ is currently undergoing a treatment to improve their vision, eliminating the need for glasses or contact lenses during the day. The treatment is referred to as the Gentle Vision Shaping System (GVSS); other names are Orthokeratology or Corneal Refractive Therapy (CRT).

Children and adults can be treated with this technique because the principle of reshaping the cornea (front surface of the eye) is effective for both. We find that in children it can slow or stop the nearsighted progression. This may result in a lower eventual prescription, so the child won't have to wear the thick glasses.

During the first few weeks without glasses, your student may request to sit in the front of the classroom. We would sincerely ask for your assistance in this matter.

If you have any questions concerning GVSS or any questions pertaining to your student's eyesight in general, please don't hesitate to contact our office.

Sincerely,

Dr. D.
